Fitting

- Fit observed $\sigma_h(W)$, $\sigma_{\pi\pi J/\psi}(W)$, $\sigma_e(W)$, and $\sigma_\mu(W)$.
- Include resonance and continuum production plus interference, beam spread (Δ), ISR and FSR.
- Assume $\Gamma_e = \Gamma_\mu = \Gamma_\tau / 0.3885$, $\Gamma_t = \Gamma_h + \Gamma_\mu + \Gamma_e + \Gamma_\tau$.
- Determine Γ_h , Γ_μ , $\Gamma_{\pi\pi J/\psi}$, $M(\psi(2S))$, Δ , and R .
- $R = 2.29 \pm 0.17$ consistent with BES R meas. ($R = 2.25 \pm 0.06 \pm 0.16$ at 3.55 GeV).
- $\Delta = 1.298 \pm 0.007$. Agrees with expected beam spread.

η_c measurements with BESII 58 M J/ψ *sample*

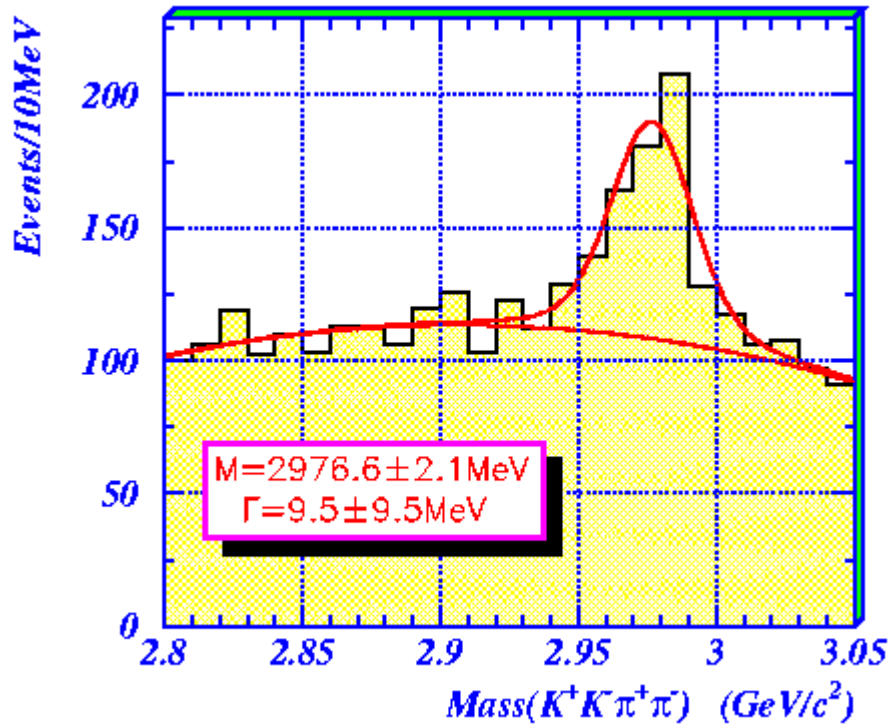

- Channels: $J/\psi \rightarrow \gamma \eta_c$, $\eta_c \rightarrow K^+K^-\pi^+\pi^-$, $\pi^+\pi^-\pi^+\pi^-$, $K^{+/-}K^0_S\pi^{-/+}$, $\phi\phi$, and $p\bar{p}$.
- Use PID for $\pi/K/p$ separation.
- Select events based on chisquare from kinematic fit.
- Use $U_{\text{miss}} = E_{\text{miss}} - p_{\text{miss}}$ and $P_{t\gamma}^2$ (transverse momentum relative to γ) to remove π^0 background.

Year 2002 $\psi(2S)$ run

BES obtained 14 M
 $\psi(2S)$ events.

Plan to obtain 24 M

Preliminary look:

$$\psi(2S) \rightarrow \gamma\gamma J/\psi, J/\psi \rightarrow l^+l^-$$

Summary

- Measured $\psi(2s)$ decay modes containing ω 's and ϕ 's. These provide more information on *12 % Rule*.
- Scan results improve on $\psi(2s)$ resonance parameters. First measurement of $\Gamma_{\pi\pi J/\psi}$.
- 58 M J/ψ sample gives improved η_C results:
$$M(\eta_C) = 2977.4 \pm 0.9 \pm 2.6 \text{ MeV}$$
$$\Gamma(\eta_C) = 15.7 \pm 3.8 \pm 10.0 \text{ MeV}$$
- New 14 M $\psi(2s)$ ($\rightarrow 24 \text{ M}$) will provide many new results.
